Power supply mounting assembly for electronic equipment

Mounting assembly for mounting a component in electronic equipment, such as a computer system, which includes an enclosure and a mounting bracket pivotally mounted to the enclosure. One or more retaining members are disposed on the bracket for engaging the component to retain the component in the bracket in abutting relationship. The bracket, and therefore the component, are connected to the enclosure so that they can be pivoted between a position in which the component is mounted in the enclosure and a position in which it extends out of the enclosure. In the mounted position, the bracket forms a portion o

Multimedia carousel for video conferencing and multimedia presentation applications

A multimedia carousel for use in video conferencing and multimedia presentation applications is disclosed. The multimedia carousel includes a cube-shaped media unit rotatably disposed on a stationary base. Each of the four outwardly facing sides of the media unit is equipped with an active color matrix display, a voice-activated charge coupled device ("CCD") camera and a microphone. A single high fidelity speaker is disposed on the top side surface of the cube for producing high quality audio output.

Claims

1. An amusement ride of the type in which passengers are transported down a vertically inclined chute having side walls, to pass through a region of the chute containing water, intended to prevent splashing of the passengers, the amusement ride comprising:

rail assemblies extending along said chute; and

a vehicle shaped to fit within the chute in spatial relation to the side walls and the rail assemblies to travel along the chute in a forward direction while maintaining such spacing, said vehicle comprising:

means for contacting the rail assemblies to guide said vehicle for motion in a forward direction longitudinally along the chute without floatation as it passes through the water filled region;

a watertight upwardly open interior region for accommodating the passengers,

a forward end and a rearward end.

Amusement ride for traveling down a water chute with reduced splash

An amusement ride includes a vehical traveling down a chute through a region of water. The vehicle is shaped to minimize splashing and to allow water to flow away from the vehicle. The vehicle flanks are curved to deflect splashing water down and away from the vehicle, and the vehicle bow has upper flanks to deflect water down and away from the vehicle. The vehicle bottom has a concave channel to accomodate water displaced by the vehicle. The vehicle has sets of wheels for traveling, for guiding lateral motion, and for interlocking with floating prevention mechanism. A groove along each side of the vehicle accomodates a splash prevention member on the water chute.
